Material Presentation (Board)

Presenting a designer's proposed material choices in a design project requires the following:

1. Identifying materials to be used for:

    Flooring
    Wall surfaces
    Ceiling and overhead planes
    Millwork
        Trim used around doors, windows, wall moldings, chair rails, wood paneling, wood doors, wood windows, and cabinetry.
    Counter tops
    Furniture and Fabrics (if applicable)

Physical materials and finishes presentation board: containing all of the significant materials and finishes you have selected for the exposed surfaces of the project.

This is to be a professional materials board: ***all samples are to be placed behind 'window' cutouts:*** samples are to be carefully attached, positioned, and edge finished. OR you may individually wrap material samples around a sub-strate (a piece of mat board for example) and then attach all of the wrapped samples to a board. All exposed edges MUST be clean, neat, and professional looking. Craft is the first thing that people see in a board!

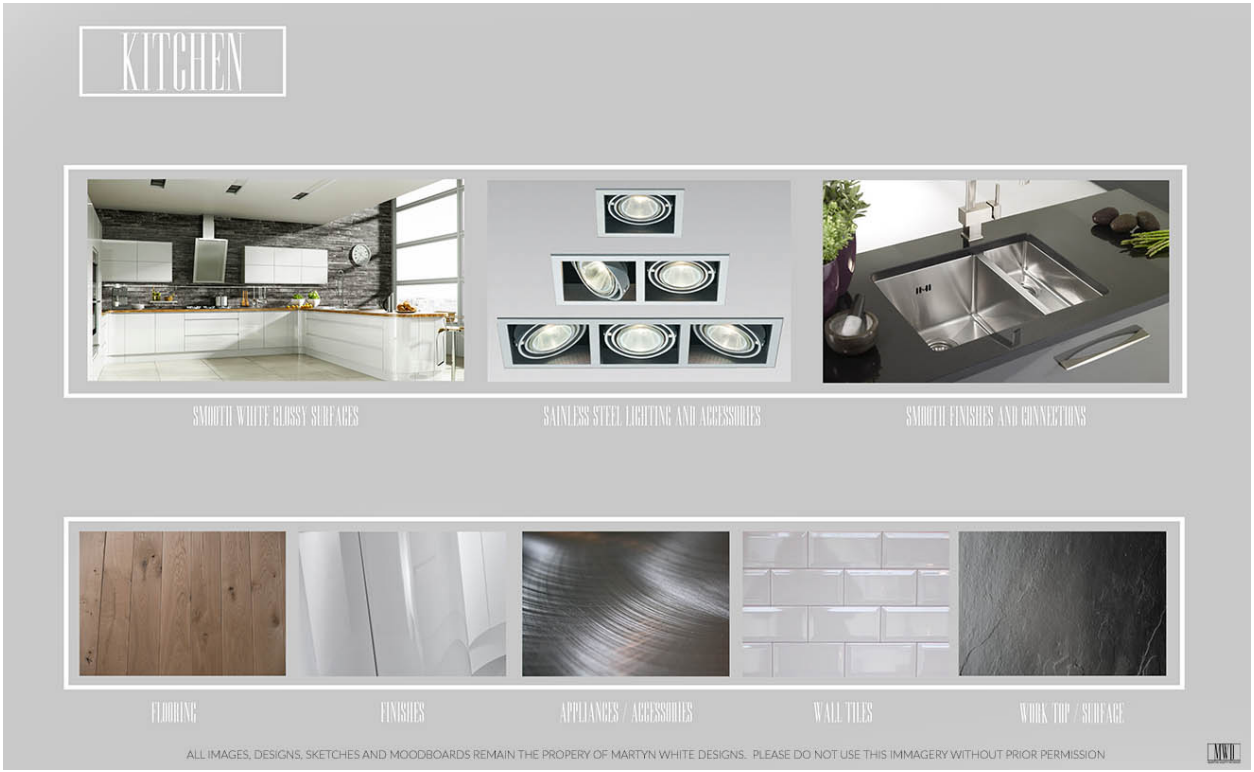

Materials are to be presented with vertical orientation: flooring materials on the bottom of the board, wall materials in the middle, ceiling materials toward the top of the board. Board size: 18" x 24" or larger.

Presentation board by Livia Fiset, Montreal, Quebec, Canada.

Windows are cut out for each sample piece.
